Package ‘poth’

November 1, 2024

Title Precision of Treatment Hierarchy (POTH)

Version 0.2-0

Date 2024-10-11

Depends R (>= 3.5.0)

Imports ggplot2, stringr, netmeta

Suggests mvtnorm

Author Augustine Wigle [aut, cre, cph]
(<`https://orcid.org/0000-0003-0225-1949`>),
Guido Schwarzer [aut] (<`https://orcid.org/0000-0001-6214-9087`>)

Maintainer Augustine Wigle <`amhwigle@uwaterloo.ca`>

Description Calculate POTH for treatment hierarchies from frequentist and Bayesian network meta-analysis. POTH quantifies the certainty in a treatment hierarchy. Subset POTH, POTH residuals, and cumulative POTH can also be calculated to improve interpretation of treatment hierarchies.

`poth-package` *poth: Brief overview of methods and general hints*

Description

R package **poth** allows to calculate the precision of treatment hierarchy (POTH) metric to quantify the uncertainty in a treatment hierarchy in network meta-analysis (Wigle et al., 2024).

Details

R package **poth** provides the following methods:

- Calculate the separation in ranking metric (`poth`)
- Conduct leave-one-out analysis (`loo.poth`)

Type `help(package = "poth")` for a listing of R functions available in **poth**.

Type `citation("poth")` on how to cite **poth** in publications.

The development version of **poth** is available on GitHub `https://github.com/augustinewigle/poth`.

`cumul.poth` *Cumulative method for precision of treatment hierarchy (POTH) metric*

Description

Cumulative method for precision of treatment hierarchy (POTH) metric

Usage

```
## S3 method for class 'poth'
cumul(x, sort = TRUE, ...)

## S3 method for class 'cumul.poth'
print(x, digits = 3, legend = TRUE, ...)

cumul(x, ...)
```

Arguments

`x`	An R object of class `poth`.
`sort`	A logical indicating whether results should be sorted by decreasing ranking metric.
`...`	Additional arguments.
`digits`	Minimal number of significant digits, see `print.default`.
`legend`	A logical indicating whether a legend should be printed.

Value

A data frame with additional class `cumul.poth` and the following variables:

`trt`	Name of added treatment.
`rank`	Treatment rank (global).
`score`	Ranking metric (global).
`poth_cum`	Cumulative POTH.

Examples

```
library("netmeta")
data(Senn2013)
net1 <- netmeta(TE, seTE, treat1.long, treat2.long, studlab,
  data = Senn2013, sm = "MD", random = FALSE)

# Cumulative method
c1 <- cumul(poth(net1))
c1
```

```
plot(c1)
plot(c1, labels = TRUE)
c2 <- cumul(poth(net1), sort = FALSE)
c2
plot(c2)
plot(c2, labels = TRUE)
```

`loo.poth` *Leave-one-out method for precision of treatment hierarchy (POTH) metric*

Description

Leave-one-out method for precision of treatment hierarchy (POTH) metric

Usage

```
## S3 method for class 'poth'
loo(x, ...)

loo(x, ...)

## S3 method for class 'loo.poth'
print(x, digits = 3, legend = TRUE, ...)
```

Arguments

`x`	An R object of class `poth`.
`...`	Additional arguments.
`digits`	Minimal number of significant digits, see `print.default`.
`legend`	A logical indicating whether a legend should be printed.

Value

A data frame with additional class `loo.poth` and the following variables:

`trt`	Treatment names.
`rank`	Treatment rank (global).
`score`	Ranking metric (global).
`poth_loo`	Leave-one-out POTH.
`resid`	Residuals (global POTH minus leave-one-out POTH.
`ratio`	Ratio of residual devided by absolute sum of residuals.

Examples

```
library("netmeta")
data(smokingcessation)
p1 <- pairwise(list(treat1, treat2, treat3),
  event = list(event1, event2, event3), n = list(n1, n2, n3),
  data = smokingcessation, sm = "OR")
net1 <- netmeta(p1, random = FALSE)

# Leave-one-out method
loo1 <- loo(poth(net1))
loo1
```

`plot.cumul.poth` *Plot cumulative precision of treatment hierarchy (POTH) values*

Description

Plot cumulative precision of treatment hierarchy (POTH) values

Usage

```
## S3 method for class 'cumul.poth'
plot(x, labels = FALSE, nchar.trts = 4, digits = 3, ...)
```

Arguments

`x`	R object of class `cumul.poth`.
`labels`	A logical indicating whether treatment names should be shown in the plot.
`nchar.trts`	Number of characters to keep for each treatment name if labels = TRUE.
`digits`	Minimal number of significant digits for cumulative POTH, see `print.default`.
`...`	Additional arguments (ignored).

Details

Plot results of cumulative method for precision of treatment hierarchy (POTH) metric (Wigle et al., 2024).

Value

A ggplot2 object.

Examples

```
library("netmeta")
data(Senn2013)
net1 <- netmeta(TE, seTE, treat1.long, treat2.long, studlab,
  data = Senn2013, sm = "MD", random = FALSE)

# Cumulative method
c1 <- cumul(poth(net1))
c1
plot(c1)
plot(c1, labels = TRUE)
c2 <- cumul(poth(net1), sort = FALSE)
c2
plot(c2)
plot(c2, labels = TRUE)
```

`plot.loo.poth` *Plot results of leave-one-out method*

Description

Plot results of leave-one-out method for precision of treatment hierarchy (POTH) metric

Usage

```
## S3 method for class 'loo.poth'
plot(x, labels = TRUE, digits = 3, ...)
```

Arguments

`x`	R object of class `poth`.
`labels`	A logical indicating whether treatment names should be shown in the plot.
`digits`	Minimal number of significant digits for global POTH, see `print.default`.
`...`	Additional arguments (ignored).

Details

Plot results of leave-one-out method for precision of treatment hierarchy (POTH) metric (Wigle et al., 2024).

Value

A ggplot2 object.

data(smokingcessation)
p1 <- pairwise(list(treat1, treat2, treat3),
  event = list(event1, event2, event3), n = list(n1, n2, n3),
  data = smokingcessation, sm = "OR")
net1 <- netmeta(p1, random = FALSE)

# Leave-one-out method
loo1 <- loo(poth(net1))
loo1
plot(loo1)

data(Senn2013)
net2 <- netmeta(TE, seTE, treat1.long, treat2.long, studlab,
                data = Senn2013, sm = "MD", random = FALSE)

# Leave-one-out method (without sorting by ranking metric)
loo2 <- loo(poth(net2), sort = FALSE)
loo2
plot(loo2)
```

`poth` *Calculate precision of treatment hierarchy (POTH) metric*

Description

Precision of treatment hierarchy (POTH) is a metric to quantify the uncertainty in a treatment hierarchy in network meta-analysis

Usage

```
poth(x, se = NULL, small.values, pooled, trts = NULL)

## S3 method for class 'poth'
print(x, sort = TRUE, digits = 3, ...)

## S3 method for class 'poth'
summary(object, ...)

## S3 method for class 'summary.poth'
print(x, sort = TRUE, digits = 3, ...)
```

Arguments

`x`	Mandatory argument with suitable information on the treatment hierarchy (see Details).
`se`	Matrix of estimated standard errors for relative effects.
`small.values`	A character string specifying whether small outcome values indicate a beneficial (`"desirable"`) or harmful (`"undesirable"`) effect, can be abbreviated.
`pooled`	A character string indicating whether the treatment hierarchy is based on a common or random effects model. Either `"common"` or `"random"`, can be abbreviated.
`trts`	An optional vector with treatment names. Must match the order of treatments provided for argument `x`.
`sort`	A logical indicating whether printout should be sorted by decreasing ranking metric.
`digits`	Minimal number of significant digits, see `print.default`.
`...`	Additional arguments (ignored).
`object`	An object of class `summary.poth`.

Details

This function calculates the precision of treatment hierarchy (POTH) metric to quantify the uncertainty in a treatment hierarchy in network meta-analysis (Wigle et al., 2024).

Argument `x` providing information on the treatment hierarchy is the only mandatory argument. The following input formats can be provided:

1. vector representing a ranking metric, i.e., SUCRAs or P-scores,
2. square matrix with the probabilities for each possible rank (with treatments in rows and ranks in columns),
3. MCMC samples (with samples in rows and treatments in columns),
4. relative effect matrix,
5. R object created with `netmeta`, `netrank`, or `rankogram` object from R package **netmeta**.

Argument `se` must be provided if argument `x` is a matrix with relative effects. Otherwise, argument `se` is ignored.

Argument `small.values` must be provided if argument `x` contains MCMC samples, relative effects, or is an object created with `netmeta`. This argument can be provided for an R object created with `netrank` or `rankogram` and is ignored otherwise.

Argument `trts` is ignored for `netmeta`, `netrank`, and `rankogram` objects.

Value

An object of class `poth` with corresponding `print` function. The object is a list containing the following components:

`poth`	Separation in ranking metric.
`ranking`	A named numeric vector with rankings, i.e., SUCRAs or P-scores.
`ranking.matrix`	A square matrix with the probabilities for each possible rank (if information is available).
`pooled`	As defined above.

Examples

```
library("netmeta")
data(smokingcessation)
p1 <- pairwise(list(treat1, treat2, treat3),
  event = list(event1, event2, event3), n = list(n1, n2, n3),
  data = smokingcessation, sm = "OR")
net1 <- netmeta(p1, random = FALSE)

# Calculate probabilities for each possible rank
set.seed(1909) # make results reproducible
rg1 <- rankogram(net1)
rg1

# Calculate POTH
s1 <- poth(rg1)
s1

# Also print probabilities for each possible rank
summary(s1)

# Use SUCRAs to calculate POTH
```

```
nr1 <- netrank(rg1)
nr1
poth(nr1)
poth(nr1$ranking.common)

data(Senn2013)
net2 <- netmeta(TE, seTE, treat1.long, treat2.long, studlab,
                data = Senn2013, sm = "MD", random = FALSE)

# Use P-scores to calculate POTH
nr2 <- netrank(net2)
nr2
poth(nr2)
```

`pscores` *Calculate P-scores from a set of relative effects and standard errors*

Description

Calculate P-scores from a set of relative effects and standard errors

Usage

```
pscores(TE, seTE, small.values = "desirable", trts = NULL)
```

Arguments

`TE`	Matrix of relative effects
`seTE`	Matrix of estimated standard errors for relative effects
`small.values`	A character string specifying whether small outcome values indicate a beneficial (`"desirable"`) or harmful (`"undesirable"`) effect, can be abbreviated.
`trts`	optional; vector of treatment names matching order in TE and sds

Value

named vector of P-scores

`rankMCMC` *Calculate a ranking probabilities matrix from MCMC samples*

Description

Calculate a ranking probabilities matrix from MCMC samples

Usage

```
rankMCMC(x, small.values = "desirable", trts = NULL)
```

Arguments

`x`	a matrix or data.frame of MCMC samples, where rows are MCMC samples and columns are relative effects (relative to anchor) for treatments. must have column names that are the name of each treatment.
`small.values`	A character string specifying whether small outcome values indicate a beneficial (`"desirable"`) or harmful (`"undesirable"`) effect, can be abbreviated.
`trts`	character vector of treatment names, optional if samples has column names

Value

A matrix of ranking probabilities where rows are treatments and columns are ranks

---

`subset.poth` *Calculate the local POTH for a subset of treatments*

Description

Calculate the local POTH for a subset of treatments

Usage

```
## S3 method for class 'poth'
subset(x, subset, top, bottom, ...)
```

Arguments

`x`	An object of class `poth`.
`subset`	A character vector of treatment names to consider as the set of competing treatments.
`top`	A single integer to define the number of treatments with the largest ranking metric to consider in subset.
`bottom`	A single integer to define the number of treatments with the smallest ranking metric to consider in subset.
`...`	Additional arguments (ignored).

Value

An R object of class `poth`.

Examples

```
library("netmeta")
data(smokingcessation)
p1 <- pairwise(list(treat1, treat2, treat3),
  event = list(event1, event2, event3), n = list(n1, n2, n3),
  data = smokingcessation, sm = "OR")
net1 <- netmeta(p1, random = FALSE)

# Use P-scores to calculate local POTH for treatments "A" and "C"
subset(poth(net1), subset = c("A", "C"))

# Use P-scores to calculate local POTH for first three treatments
subset(poth(net1), top = 3)

# Use P-scores to calculate local POTH for first three treatments
subset(poth(net1), bottom = 3)
```

`Xu2018` *Safety of Immune Checkpoint Inhibitors in Cancer*

Description

Data from a network meta-analysis on immune checkpoint inhibitors (ICIs) to assess the safety of ICI drugs as cancer treatment (Xu et al., 2018).

Format

A data frame with the following columns:

studyID	study id
treatment	treatment name
adverse	number of adverse events
n	group sample size

Details

Data were obtained from Rosenberger et al. (2021), who re-analysed the data. There are seven treatments and 23 studies. The outcome of interest is the number of treatment-related adverse events, so smaller values indicate a safer treatment.
